1. INTRODUCTION

In this report we present the source listing of a computer code for calculating two-dimensional (planar) inlet flow fields in a supersonic free stream including viscous effects. A test case illustrating the application of this code to an inlet on an airbreathing missile is also presented. The inlet code and the associated mesh generation code have been documented in detail elsewhere (refs. 1, 2, and 3).

The problem formulation, mathematical framework, and the overall logic of the inlet program are presented in reference 1. The program makes use of an implicit algorithm (ref. 4) to solve the two-dimensional time-dependent Euler equations or the thin-layer Navier-Stokes equations. Reference 2 contains a discussion of the results that we obtained for various test cases. All the calculations were done for the inlet geometry shown in figure 1 for which the design Mach number is 3.5. For the test case presented herein, the inlet is considered to be located at $z = 4.5$ on the forebody of figure 2. The inflow boundary conditions for the inlet calculation are obtained from the code of reference 5 as applied to this forebody. In this report we present the input data, specification of initial and boundary conditions, operating instructions, and answer listings obtained from the Euler version of the two-dimensional inlet code for this test case. The method of transforming variables from the forebody code output to the inlet code input is also discussed. The complete listing of the inlet code is given in Appendix A.

During the course of this work we have also done some preliminary calculations for an inlet with uniform inflow boundary conditions and with the inclusion of viscous effects. The method of implementing uniform inflow boundary conditions is discussed in references 3 and 6. In the case of viscous calculations we have not attempted to make any changes to the inflow boundary conditions and hence these were implemented as in an inviscid flow.

2. SAMPLE PROBLEM: CALCULATION OF A TWO-DIMENSIONAL INLET WITH NONUNIFORM INFLOW BOUNDARY CONDITIONS

The capability of the inlet calculation procedure to calculate a realistic situation in which the inlet is immersed in the flow field produced by a forebody was tested by using nonuniform inflow boundary conditions. To this end the computer code detailed in reference 5 was used to generate a solution at $M_\infty = 3.5$ and at zero angle of attack for a forebody consisting of a 2.46 caliber von Karman ogive nose coupled to a cylindrical section (fig. 2). The ratio of body diameter is representative of a realistic configuration.

The solution at $X'/D = 4.5$ was used as the inflow boundary condition for the inlet calculation. On this boundary, the Mach number varied from 3.465 near the ramp to 3.192 at the farthest point from the ramp within the forebody shock. For reasons of economy we have located this boundary just downstream of the ramp leading edge. We have, therefore, assumed the first four points on this boundary away from the ramp surface to be downstream of an oblique shock with a constant 3.465 upstream Mach number. We do not expect this to introduce any significant error because the actual maximum Mach number variation over these four points was about 1%. For all the other points outside the

ramp shock, exact values from the forebody solution were used as described below.

The forebody code gives values of P/P_∞ and ρ/ρ_∞ on the body surface as well as profiles of P/P_{ref} , ρ/ρ_{ref} , U/M_∞ , and V/M_∞ at specified streamwise locations. The inlet code requires as inflow boundary conditions values of P/P_∞ , ρ/ρ_∞ , U/U_∞ , V/U_∞ , V/U_∞ , and e . For points other than the one on the body surface the desired form of pressure, P/P_∞ , is calculated as

$$\frac{P}{P_\infty} = \frac{P}{P_{\text{ref}}} \cdot \left(\frac{P}{P_\infty} \right)_{\text{surface}} \cdot \left(\frac{P_{\text{ref}}}{P} \right)_{\text{surface}} \quad (1)$$

and likewise for density, ρ/ρ_∞ . The desired forms of the velocities are found from the forebody output as

$$\frac{U}{U_\infty} = \frac{U}{M_\infty \cdot a}, \quad \frac{V}{U_\infty} = \frac{V}{M_\infty \cdot a} \quad (2)$$

where M_∞ is the free-stream Mach number and "a" the local speed of sound. Finally, the energy is calculated from

$$e = \frac{P/P_\infty}{\gamma-1} + \frac{1}{2} \rho/\rho_\infty \left[\left(\frac{u}{U_\infty} \right)^2 + \left(\frac{v}{U_\infty} \right)^2 \right] \quad (3)$$

Formulae 1, 2, and 3 constitute the relations employed to convert the output of the forebody code to the input of the inlet code.

It should be noted that the mesh spacing in each program can be adjusted independently. Hence, in this work we have simply set the mesh sizes in each of the calculations (for the forebody and the inlet) equal to each other; we have not found it necessary to interpolate between the two meshes.

TABLE 1.- LIST OF INPUT CARDS

Card Number	Format	Variables
1	815	NMAX: Maximum number of time steps JMAX: Maximum number of points along ξ KMAX: Maximum number of points along η NP: Number of time steps for calling SUB.MAP
	815	METH: Flag for upwind differencing. If METH > 0, program skips upwind differencing IREAD: Option for grid system. If IREAD > 0, reads grid from disc INVIS: If INVIS > 0, program accounts for viscous effects; if INVIS = 0, the calculation is inviscid
2	715	IREGO: If IREGO > 0, reads initial field from disc, otherwise starts from free-stream conditions ISTORE: If ISTORE > 0, solution data stored on disc NF : variables used in airfoil calculations; set to zero NB : JTALL1: First ξ -interior point, set to 1 JTALL2: Last ξ -interior point, set to JMAX-1 IPLOT: Index for calling plot routine
3	315	IUPWIND: If IUPWIND > 0, skips upwind differencing IOSCIL: For stationary airfoil set IOSCIL = 0 LAMIN: If LAMIN > 0, calculates turbulent viscosity

TABLE 1.- CONCLUDED.

Card Number	Format	Variables
4	8F10.0	CNBR: Courant number; set to about 10 DX: x-increment used in SUB.GRID. For grid read off the disc set DX = 0 DY: y-increment, as above FSMACH: Free-stream Mach number SMU: Pseudo viscosity coefficient. Set to about 10 times the time step
	8F10.0	EPS: Used in SUB.GRID. Here set EPS = 0 RE: Reynolds number ALPHA: Angle of attack
5	4F10.0	XOSCIL } VARA } VARB } VARC } Variables required for oscillating airfoil. For the inlet flow set to zero
6-18	4F10.5	Q_1 } Q_2 } Values of flow field variables in conservation form calculated from Q_3 } Q_4 } the forebody output via formulae 1-3
19	I5	Variable read by HARVIO for output, set to 0
20	I3	Variable read by HARVIO for output, set to 1
21	I3	Variable read by HARVIO for output, set to 1
22	2I5	Variable read by HARVIO for output, set to 1 and 0
23	212	LFAC: If LFAC = 1 outflow is subsonic, otherwise it is supersonic JAXI: If JAXI = 0 flow is plane 2-D, if JAXI = 1 flow is axisymmetric

(Note that axisymmetric option has been added only for the inviscid case. When calculating viscous flows, set JAXI = 0.)

2.1 Program Use and Operation

In this section we give a description of the input information required to run the test case described above. The initial field, as well as values of various constants are evaluated in SUB.INITIA. This subroutine also reads the input data except for the last card, which specifies geometry and type of duct-outflow boundary condition to be used. This last card is read by SUB.BC. The input data cards are listed in order in table 1.

The input cards used for the test case are shown in table 2. The number of points on the inflow boundary to be placed downstream of the ramp shock is prescribed in SUB.INITIA. This is done by changing the indices of the DO LOOP that ends with statement "31 CONTINUE". The first index of the DO LOOP parameter, J, is set to the ξ -index of the mesh point that corresponds to the first point on the inflow boundary (point A in fig. 3) whereas the second index specifies the ξ -index of the last grid point on the inflow boundary that is contained within the ramp shock (point B, fig. 3). Values for the variables at the mesh points A through B are prescribed in this subroutine using 2-D oblique shock theory by setting the value of the variable STHETA equal to the ramp shock angle in degrees.

2.2 Output Listing

The typical output of the program involves the following (described in more detail in ref. 2).

1. Tabulation of the input parameters.
2. Printout of the Jacobian matrix as calculated from the generated grid.
3. A map of the transformation Jacobian.
4. Printout of the flow field variables on the cowl surface.

TABLE II.- SAMPLE INPUT AND TEST CASE

15.00 73 86 50 0 1 0

1

5. Free-stream quantities given by SUB.HARVIO.
6. Iteration index, physical time and time step.
7. Maximum ERRORS occurring within the field.
8. Values of LFAC (if LFAC > 1 outflow is subsonic) and JAXI.
9. Mass flow ratio evaluated at various ξ - stations.
10. Residual quantity; must converge to a small number such as $O(10^{-1}) - O(10^{-2})$.
11. Line-printer plot of pressure in the computational plane.
12. Line-printer plot of C_p on the ramp surface.
13. Line-printer plot of C_p on the cowl surface.
14. At time step equal to NMAX total output as furnished by HARVIO which includes listings of pressure, velocity components, energy, entropy, enthalpy, Mach number, contravariant velocity components and pressure coefficient.

Finally, the output contains the following quantities at each n station (referred to as the first index in the output listing) for each consecutive ξ station (referred to as the second index in the output listing): the Jacobian of transformation, x and y coordinates of each grid point, the metrics of transformation and the internal energy. A sample output listing is given in Appendix B.

1. Report No. NASA CR-3414	2. Government Accession No.	3. Recipient's Catalog No.	
4. Title and Subtitle CALCULATION OF TWO-DIMENSIONAL INLET FLOW FIELDS BY AN IMPLICIT METHOD INCLUDING VISCOUS EFFECTS- PROGRAM DOCUMENTATION AND TEST CASE		5. Report Date June 1981	
7. Author(s) Sedat Biringen and Oden J. McMillan		6. Performing Organization Code 611/C	
9. Performing Organization Name and Address Nielsen Engineering & Research, Inc. 510 Clyde Avenue Mountain View, CA 94043		8. Performing Organization Report No. NEAR TR 233	
12. Sponsoring Agency Name and Address National Aeronautics and Space Administration Washington, DC 20546		10. Work Unit No. 11. Contract or Grant No. NAS1-15951	
		13. Type of Report and Period Covered Contractor Report 9/12/79-11/30/80	
		14. Sponsoring Agency Code 505-43-23-02	
15. Supplementary Notes Langley Technical Monitor: Wallace C. Sawyer Final Report			
16. Abstract In this report the source listing of a computer code for calculating two-dimensional (planar) inlet flow fields in a supersonic free stream including viscous effects is given. A test case illustrating the application of this code to an inlet on an airbreathing missile is also presented.			
17. Key Words (Suggested by Author(s)) Calculation method Inlets Inviscid flow Supersonic flow Viscous flow		18. Distribution Statement Unclassified - Unlimited Subject Category 02
